How Many People Need to Receive the Covid Vaccine for Normalcy to Resume? Plus Side Effects!

tonyodarg.wordpress.com/2020/12/04/covid-vaccine-side-effects

Tony Odarg December 4, 2020

The antivax movement is out of control these days, as we finally head towards a vaccine. They are claiming the vaccine will have nanotechnology, cause mass infertility and change genes through mRNA. These are the same people who take their phone literally everywhere they go. You're already being surveilled, you willing dupes. Regarding mass infertility, would that really be a problem? Would the global population going down to less than a billion people really be so catastrophic? If anything, it would fix the planet and perhaps lead to White ethnocentrism. Then there is the issue of genes being altered, as though the environment and the processed food you eat doesn't do that already to some degree. I used to oppose gene editing/altering and it obviously must be done with great caution. But to breed a new group of humans who can't get aids or cancer for example, at little to no side effect cost, who wouldn't want that? Sign me up. But the big question is how many people need to the get the vaccine for it to even be effective, a huge problem with the flu vaccine, which antivaxxers claim doesn't work, which is only true because not enough people get it?

> Right now, scientists estimate that each person with SARS-CoV-2 can infect two to three people. Assuming that vaccines can prevent the transmission of SARS-CoV-2, and that their effectiveness is close to their clinical trial efficacy, that means herd immunity will likely be achieved when 60% to 70% of people in a community are vaccinated, says Singer. In the US, this would mean vaccinating between 197 million and 230 million citizens. Globally, it'd be between 4.7 billion and 5.5 billion people.

And this can be done. The World Health Organization, operating at the budget of a local hospital, eliminated small pox by vaccinating hundreds of millions of people in India. It can be done, but it takes cooperation and preferably leadership from thought leaders. Imagine if Trump got the vaccine publicly and urged all his supporters to do so? That'd go a long way to convincing many skeptics of the necessity of public health measures.
